

Requirement Elicitation Techniques

1. Stakeholder: Students (Complainants)

Technique Used: Survey / Questionnaire

- Students form the largest and most diverse user group of the system, so a technique that scales was needed. Surveys allowed the team to reach many respondents quickly, capture a broad range of complaint scenarios (hostel, mess, academic, infrastructure), and identify patterns and frequency in how students currently report issues insights that interviews with a small number of people would not reliably surface at this scale.

2. Stakeholder: Hostel Management Committee (HMC)

Technique Used: Interviews (3 members)

- HMC members are domain experts on hostel-related complaint handling they understand the existing (often informal) process, common complaint categories, escalation pain points, and the information they need from a complainant to act on an issue. Interviews allowed deeper, open-ended probing into this operational knowledge than a survey could provide. Since HMC members are themselves students, the interviews also captured a dual perspective administrator and peer of the complaint process.

3. Stakeholder: Cafeteria Management Committee (CMC)

Technique Used: Interview (1 member)

- The CMC handles a narrower, more specialized complaint category (food quality, hygiene, service). A focused one-on-one interview was sufficient to understand the current workflow, response expectations, and the specific data (e.g. time of meal, counter or item involved) needed to investigate a complaint effectively.

Summary

Stakeholder	Technique	Respondents	Reason
Students	Survey	Multiple(broad reach)	Large, diverse group needed scale and pattern detection
Hostel Management Committee (HMC)	Interview	3	Domain expertise on hostel complaint work flows; deep, open-ended insight
Cafeteria Management Committee (CMC)	Interview	1	Narrow, specialized domain; single knowledgeable respondent sufficient
